Preservation Methods and the Degradation of Dust Print Lifts

Marcy Hendricks

Abstract

In this study, the author examined the different types of physical preservation methods for dust print lifts. Dust impressions were collected with Superprint's electrostatic dust print lifter and documented at one week intervals with examination quality photography. Results indicated that storing dust print lifts taped to the top of cardboard mailing boxes produced the least amount of degradation to the print. Further, examination quality photography is widely heralded as the only sure method to maintain the detail of a freshly lifted dust impression. Therefore, the results of this study also illustrated the damaging effects of short term storage on dust print lifts and therefore highlighted the importance of immediate photography upon collection of dust impressions.

Introduction

By providing law enforcement and investigation agencies with a method in which to collect dust print impressions, the development of the electrostatic dust print lifter (ESDL) has significantly improved the ability to document and collect dust impression evidence during crime scene processing. In the field of crime scene investigation and footwear impression evidence, it is widely recognized that photography is the only certain method for preserving the detail of a electrostatic lifted dust impression.

Photographing dust print lifts immediately is especially important because they inherently degrade over time; one of the largest problems investigators have encountered with the use of the ESDL is the fragile nature of the dust print lift. Anything brushing against the impression could obscure the image or remove parts of it, which also remains a problem throughout the life of the print in storage. Further, the Mylar film used to collect the impression naturally attracts excess dust.

Despite the consensus that the most beneficial way to preserve the quality of dust print lifts for future examination purposes is immediate photography, there has been minimal research to suggest the best physical storage methods. Arrowhead Forensics recommends storing the dust print lift in an A-5031-F manila IR folder, as provided in their Arrowhead Stat-Lift Kit. Evident Crime Scene Products suggests using one of their firm and cast boxes for preserving dust print lifts, which they sell separately. Recommendations from footwear impression evidence professionals include the use of folders and shallow
